

Pim Pijnappel is Associate Professor at the Center for Lysosomal and Metabolic Diseases, Erasmus MC, Rotterdam, The Netherlands, where he heads a basic and translational research group on lysosomal storage diseases, with a focus on Pompe disease and Mucopolysaccharidoses. He has broad expertise in cell and molecular biology and received training at the Hubrecht laboratory (Utrecht) and European Molecular Biology Laboratory (Heidelberg). His research group works on the development of novel therapeutic approaches for lysosomal diseases including stem cell-based gene therapy and antisense oligonucleotides, improved diagnostics, molecular mechanisms of disease and the effects of enzyme replacement therapy. Recent highlights include the development of RNA-based and lentiviral-based gene therapies for Pompe disease, extension of the Pompe mutation database and identification of a genetic modifier of symptom onset in Pompe disease, and the development of human iPSC-based (3D) model systems for skeletal muscle and cartilage.
